

MY PORTFOLIO

PERSONAL INFORMATION

Full Name: ADENIJI ALHAKAM TOLUWANIMI

Email: adenijihakam@gmail.com

Phone: 08115908693

Location: Lagos, Nigeria

ABOUT ME

I am a Software Engineering student of Babcock University with a strong interest in software development and web technologies. I enjoy building practical applications using programming languages such as C++, Python, Java, and web technologies like HTML and CSS with a bit of javascript. I am currently seeking internship opportunities to further develop my technical skills and gain real-world experience in software development.

TECHNICAL SKILLS

- C++ Programming
 - Python Programming
 - HTML & CSS
 - Cloud Computing
 - Problem Solving
 - Basic Software Development
 - VS Code
 - Debugging and Testing
-

PROJECTS

Project 1: C++ Bank Service System

Description:

A console-based bank service system developed using C++ that simulates basic banking operations

such as account creation, deposits, withdrawals, and balance checking. The project demonstrates the use of functions, control structures, and basic data handling in C++.

Features:

- Account creation system
- Deposit and withdrawal functionality
- Balance inquiry
- Console-based user interaction

Tools Used: C++, VS Code

Status: Completed and successfully running

The screenshot displays the Visual Studio Code interface. The editor window shows a C++ file named `seasalt1.cpp` with the following code:

```
252 int main() {
253     while (true) {
254         if (choice == 1) {
255             accounts.push_back(newAccount);
256             cout << "Account created!" << endl;
257         }
258         else if (choice == 2) {
259             int accNum;
260             double money;
261             cout << "Enter account number: ";
262             cin >> accNum;
263             bool found = false;
264             for (int i = 0; i < accounts.size(); i++) {
265                 if (accounts[i].getAccountNumber() == accNum) {
266                     cout << "Enter money to deposit: ";
267                     cin >> money;
268                     accounts[i].deposit(money);
269                     found = true;
270                     break;
271                 }
272             }
273             if (!found) {
274                 cout << "Account not found!" << endl;
275             }
276         }
277     }
278 }
```

The terminal window at the bottom shows the execution of the program. It displays a menu with options: 1. Create Account, 2. Deposit Money, 3. Withdraw Money, 4. Show Account, 5. Take Loan, 6. Exit. The user enters '1' to create an account, provides the name 'hakam', account number '1234', and starting money '5000'. The program outputs 'Account created!'. The user then enters '3' to withdraw money, provides the account number '1234', and the amount '2330'. The program outputs 'Money withdrawn successfully!' and 'New balance: 2670'.

Project 2: Python Calculator Program

Description:

A Python-based calculator program that performs basic arithmetic operations as well as advanced computations such as factorial and Fibonacci sequence generation. The project demonstrates the use of functions, loops, and conditional statements.

Features:

- Basic arithmetic operations (add, subtract, multiply, divide)
- Factorial calculation

- Fibonacci sequence generation
- User input handling

Tools Used: Python, VS Code

Status: Completed and running successfully

The screenshot shows a VS Code editor window with a file named 'simplecalc.py' open. The code is a Python script that implements a simple calculator. It features a menu-driven interface where the user can choose from seven options: 1. Addition, 2. Subtraction, 3. Multiplication, 4. Division, 5. Factorial, 6. Fibonacci, and 7. Exit. The script uses a while loop to keep the menu active until the user chooses to exit. For the addition option, it prompts the user to enter two numbers and then prints the result. The terminal output shows the script being executed, displaying the menu and the result of an addition operation (50 + 4 = 54).

```

21 while True:
22     print("\n===== SIMPLE CALCULATOR =====")
23     print("1. Addition")
24     print("2. Subtraction")
25     print("3. Multiplication")
26     print("4. Division")
27     print("5. Factorial")
28     print("6. Fibonacci")
29     print("7. Exit")
30
31     choice = int(input("Enter your choice: "))
32
33     if choice == 1:
34         a = float(input("Enter first number: "))
35         b = float(input("Enter second number: "))
36         print("Result = ", a + b)
37
38     elif choice == 2:

```

Terminal Output:

```

mac@Alhakams-MacBook-Air COS202 % /usr/bin/python3 /Users/HP/OneDrive/Docu
ments/COS202/simplecalc.py
===== SIMPLE CALCULATOR =====
1. Addition
2. Subtraction
3. Multiplication
4. Division
5. Factorial
6. Fibonacci
7. Exit
Enter your choice: 4
Enter first number: 50
Enter second number: 4
Result = 54
===== SIMPLE CALCULATOR =====
1. Addition
2. Subtraction
3. Multiplication
4. Division
5. Factorial
6. Fibonacci
7. Exit
Enter your choice:

```

Project 3: YouTube Homepage Clone (HTML & CSS)

Description:

A front-end web development project where a simplified version of a YouTube homepage was recreated using HTML and CSS. The project focuses on layout structuring, styling, and visual replication of a real-world interface.

Features:

- Responsive page layout
- Navigation bar and sidebar structure
- Video grid layout design
- UI styling using CSS

Tools Used: HTML, CSS, VS Code

Status: Completed (static UI clone)

EXTRAS

Udemy Course: Basics of Cloud Computing with AWS, Azure and GCP Tools

Platform: Udemy

Status: Completed

Description:

Completed a foundational course in cloud computing covering the core concepts of cloud technology and how modern cloud platforms are used in real-world applications. The course provided an introduction to major cloud service providers and their tools, helping build a strong understanding of cloud infrastructure and deployment models.

Key Topics Covered:

- Fundamentals of Cloud Computing
- Introduction to AWS (Amazon Web Services)
- Introduction to Microsoft Azure
- Introduction to Google Cloud Platform (GCP)
- Cloud deployment models (IaaS, PaaS, SaaS)
- Basic cloud storage and computing services

Skills Gained:

- Understanding of cloud computing concepts and architecture
- Awareness of major cloud platforms (AWS, Azure, GCP)
- Basic knowledge of cloud service models
- Foundation for DevOps and cloud engineering pathways
- Improved technical awareness of modern software infrastructure

Application in Projects:

This knowledge strengthened my understanding of how software systems can be deployed and managed in cloud environments, and supports my interest in backend development and DevOps-related career paths.
